

Making the most of our time

A clean bill of operational health for a life sciences client

A life sciences client, was suffering from time-consuming and cumbersome processes that were making efficiently briefing executives a painful procedure. They needed a Microsoft OpenAI-based automation solution to streamline processes and reduce operational costs, freeing up time that could be spent on other things and helping the company keep pace with an ever-changing global market.

Working with our partner, Microsoft, we designed and implemented Azure-based tools that used Agentic Retrieval-Augmented Generation (RAG) Gen AI technology to fetch insights from a library of market trends, past briefings and company policies. The client can now use Microsoft OpenAI to generate trustworthy, contextual content, effectively automating executive-level briefings. Most importantly, we made room for future innovation, by designing solutions that could be scaled up.

End users have reported

+50% efficiency

researching and creating briefs, which means

+30% productivity

and reduced operating costs, all thanks to powerful, automation.

And we think that's a clean bill of health.
